Fields & Theories:

- **Fields:** Strategic Management, Organizational Economics, Human Resource Management
- **Theories:** Principal-Agent Theory, Strategic Complementarity, Delegation Theory

Abstract:

The economic literature on delegation focuses on the subordinate's improved motivation when liberated from managerial intervention in decision making. However, many managers motivate employees while proactively intervening in the decision-making process. We build a principal-agent model to analyze when managerial intervention is, and is not, motivational to the agent. Although managerial intervention may demotivate the agent when leading to actions that waste employee effort, managerial intervention can also motivate the agent by incentivizing principal effort that complements the agent's effort. In fact, delegation may demotivate the agent when the principal and agent work collaboratively. Our results speak to understanding the role of strategic complementarity in determining when various managerial practices do, and do not, motivate employees. History: Accepted by Maria Guadalupe, business strategy.

Fields & Theories:

- **Fields:** Finance, Strategic Management, Mergers and Acquisitions
- **Theories:** Financial Intermediation Theory, Information Asymmetry, Relational Banking

Abstract:

We study the dynamics of firm-bank relationships following corporate acquisitions using a novel firm-bank data set for 23 European countries over 2008–2014. Our data allows us to track changes in both firm ownership and bank relationships over time. To examine the effect of ownership change on bank relationships, we combine a difference-in-differences approach with matching. We find that the majority of acquisitions are associated with substantial changes in bank relationships of target firms. Acquiring firms actively change the composition of these relationships, incorporating banks with superior knowledge of the target's local market or with expertise in the target's industry. This reallocation appears to mitigate informational frictions associated with the acquisition. Our findings are consistent with theories of financial intermediation that emphasize the role of banks in accumulating and providing soft information about the real economy. Fields & Theories:

- **Fields:** Organizational Theory, Human Resource Management, Career Studies
- **Theories:** Exploration-Exploitation, Person-Environment Fit, Human Capital Theory

Abstract:

Project-based organizations allow employees in ostensibly similar roles to acquire very different experiences by working on different kinds of projects. We study how people build careers in these contexts, examining when employees choose to diversify their experience—both in terms of project content and collaborators—and how the resulting diversification affects their career advancement. Using longitudinal project data from a services organization, our results suggest that employees initially explore different kinds of work by moving across project types, but then go on to find their fit in a particular area. This process is quicker for high-performing employees and for those with longer tenure and more diverse collaborator networks. We also find that promotion rates and compensation are lower for employees who worked on a broader portfolio of content types and collaborators in the most recent year, but higher for employees who had worked on broader project portfolios in prior years. Fields & Theories:

- **Fields:** Entrepreneurship, Organizational Behavior, Labor Economics
- **Theories:** Theory of Compensating Differentials, Signaling Theory, Equilibrium Modeling

Abstract:

I document the advertised corporate culture among start-up firms from an online job board. Two corporate culture types emerge: one that concerns the well-being of employees (worker-centered culture) and another that emphasizes other values, such as customers, firms, and markets (firm-centered culture). The worker-centered culture attracts 20% more applications than the other culture type. Firms advertising the worker-centered culture pay 5% lower salaries than measurably similar jobs. Outcomes do not significantly differ among firms that promote different types of corporate culture. To assess whether a worker-centered culture is adopted to reduce labor costs or enhance productivity, I develop an equilibrium model. The model implies that many firms adopt a worker-centered culture primarily for cost savings. History: Accepted by Ashish Arora, entrepreneurship and innovation. Fields & Theories:

- **Fields:** Finance, Asset Pricing, Financial Economics
- **Theories:** Intertemporal CAPM, Efficient Market Hypothesis, Risk Premium

Abstract:

Studying a large set of macroeconomic announcements (MAs) and disentangling their news content, we show that a portfolio of stocks that pays off around MAs that negatively impact the aggregate stock market commands a positive risk premium. Adding this portfolio to a position in the aggregate market substantially increases Sharpe ratio while reducing MA risk exposure, which implies a rejection of the CAPM. Using state-of-the-art measures of cash flow and discount rate news and consistent with prominent intertemporal CAPM specifications, we argue that the portfolio's risk premium compensates investors for large reinvestment risk. Thus, we conclude that the MA news that matters most to investors is discount rate news and not cash flows news. History: Accepted by Lukas Schmid, finance. Fields & Theories:

- **Fields:** Finance, Asset Pricing, Fixed Income Markets
- **Theories:** No-Arbitrage Theory, Factor Risk Premia, Term Structure Modeling

Abstract:

Assuming no arbitrage and that a polynomial in the time to maturity approximates spot-rate increments, we develop a consistent approach to estimate factor risk premia in the bond market. This approach is attractive, as the underlying risk factors are the time-varying coefficients of the polynomial specification, and the factor loadings correspond to familiar bond risk characteristics, such as duration and convexity. Our two-factor model—with a positive (negative) duration-factor (convexity-factor) risk premium—is easy to estimate and provides straightforward economic intuition for the concave term structure of bond risk premia and the downward-sloping term structure of bond Sharpe ratios. Our model decomposes the conditional factor risk premia into a “status quo” component—the expected factors’ realizations when expected spot-rate increments are zero—and the factors’ forecasts. The status quo factor risk premia provide measures of the state of fixed income markets that both outperform alternative measures and are easily estimated in real time; moreover, the underlying risk factors and their loadings are familiar to and readily interpreted by investors and traders. History: Accepted by Lukas Schmid, finance. Supplemental Material: The online appendix and data files are available at <https://doi.org/10.1287/mnsc.2023.00212>.

Fields & Theories:

- **Fields:** Finance, Behavioral Finance, Asset Pricing
- **Theories:** Extrapolative Beliefs, Overreaction Theory, Limits to Arbitrage

Abstract:

We find that the degree of extrapolative weighting in investors' beliefs (DOX) has strong predictive power for a broad set of overreaction-related anomalies in the stock market. The average return spread of these anomalies is about 0.86% per month following high DOX periods and 0.31% per month following low DOX periods. In sharp contrast, DOX has opposite, but weaker, predictive power for underreaction-related anomalies. In addition, the predictive power of DOX is robust after controlling for a broad set of economic forces. Moreover, most of the DOX effect on long-short anomaly returns derives from the short legs of these overreaction-related anomalies, suggesting that time variation in DOX leads to more time variation in overpricing than in underpricing, probably because of short-sale impediments. Fields & Theories:

- **Fields:** Finance, Real Estate Finance, Urban Economics
- **Theories:** Search and Matching Theory, Market Frictions, Equilibrium Asset Pricing

Abstract:

We use a unique data set of individual housing transaction histories from Norway and a novel shift-share design to show that temporary changes in the transaction sequencing decisions of moving homeowners—whether to buy first and then sell or vice versa—cause temporary local increases in house prices and seller liquidity. Our findings are consistent with a simple theory of how transaction sequencing decisions impact house prices in a frictional housing market. We also provide the first causal estimate of the elasticity of house prices to market tightness, which is around 0.1. Overall, our findings highlight the importance of trading frictions and supply-demand imbalances for housing market dynamics. History: Accepted by Bo Becker, finance. Funding: This work was supported by Norges Forskningsråd [Grant 274678: Frictions in the Housing Market]. - **Theories:** Signaling Theory, Relational Exchange Theory, Joint Value Creation

Abstract:

Many firms are pledging to reduce greenhouse gas emissions across their value chains. However, this requires their suppliers to also adopt more climate-friendly practices for decarbonization. This can involve addressing gaps in not only the suppliers' ability but also, their willingness to adopt such practices, which can be challenging if the suppliers perceive the practices as risky or potentially detrimental to their economic well-being. We examine the effectiveness of relational investments to help mitigate this challenge, arguing that such investments can serve as a signal of the firm's commitment toward joint value creation. In a field experiment conducted with supplier farmers in a multinational firm's agricultural supply chain in India, we examine the impact of two kinds of relational investments in providing the farmers with customized agricultural services that they valued. In the first intervention, the firm's field officers offered the farmers support specific to the crop that the firm sourced from them. The second intervention additionally involved bringing in expert agronomists to also provide the farmers with support on broader agricultural matters of interest to them. Relative to a control condition in which the farmers only received training on the relevant climate-friendly practices, both interventions improved the farmers' adoption of the recommended practices. The second intervention was more impactful than the first in improving the farmers' practice adoption as well as their retention with the firm. Exploratory mediation analysis and post-experiment field interviews suggest that these findings are partly driven by the farmers' positive perception of the firm's relational investments. Fields & Theories:

- **Fields:** Strategic Management, Corporate Governance, Finance, Organizational Theory
- **Theories:** Gender-based Discrimination, Behavioral Theory of the Firm, Bargaining Theory

Abstract:

We study the role of gender in corporate debt renegotiation. Using in-court reorganizations from Brazil, we find that male-led creditors are more likely to reject plans put forward by female-led debtors. Although we cannot definitively identify the underlying mechanism driving this pattern, our findings align more consistently with gender-based discrimination compared with alternative explanations. This behavior may be costly: Female-led debtors deliver higher recoveries under reorganization than under liquidation, implying that rejections potentially create deadweight losses. Supporting a miscalibrated-beliefs explanation, we observe that the gender-based rejection gap narrows when male creditors have prior exposure to successful female-led businesses, pointing to a potential path for mitigation. History: Accepted by Bo Becker, finance. Supplemental Material: The online appendix and data files are available at <https://doi.org/10.1287/mnsc.2024.05802>.

Published: 2026-02-17

Fields & Theories:

- **Fields:** Finance, Financial Technology, Market Microstructure
- **Theories:** Market Microstructure Theory, Liquidity Provision Modeling, Incentive Theory

Abstract:

We model endogenous trading and liquidity provision at a decentralized exchange (DEX) and demonstrate that increasing DEX trading fees can increase DEX trading volume. DEXs employ a mechanical pricing rule whereby price impacts decrease with inventory that DEXs acquire by offering fee revenues to investors. Consequently, higher DEX fees can incentivize higher inventory, thereby reducing price impacts. Moreover, the reduction of price impact can offset the increase in fees so that the marginal cost of DEX trading declines despite charging a higher trading fee. In turn, lower DEX marginal trading costs lead to an increase in DEX trading volume. History: Accepted by Agostino Capponi, finance.

Published: 2026-02-16

Fields & Theories:

- **Fields:** Finance, Asset Pricing, Behavioral Finance
- **Theories:** Dynamic Portfolio Theory, Transaction Cost Theory, Prospect Theory

Abstract:

We develop a dynamic portfolio model incorporating capital gains tax (CGT), transaction costs, and year-end taxation. We find that even tiny transaction costs can lead to significant deferral of large losses and that transaction costs affect loss deferrals much more than gain deferrals. Our model can thus help explain the puzzle that even when investors face equal long-term/short-term CGT rates, they may still defer realizing large capital losses for an extended period of time, displaying the disposition effect. In addition, we find that misestimating transaction costs is costly. We also provide several unique, empirically testable predictions and shed light on recently proposed tax policy changes. - **Theories:** State Price Density Theory, Nonparametric Statistical Estimation, Asset Pricing Theory

Abstract:

This paper proposes and implements a novel nonparametric method for estimating the state price density (SPD) over the entire state space, including the tails. This SPD estimator achieves shape consistency properties in theory, particularly at the tails. Monte Carlo simulations demonstrate the accuracy and robustness of our method. In particular, our estimator accurately captures the risk-neutral tail distribution, which is often underestimated by existing alternative methods. In an empirical analysis based on Standard and Poor's 500 options data, we evaluate the out-of-sample performance of our SPD estimation method and demonstrate that the estimates can serve as effective indicators for market conditions and exhibit predictive power for asset returns. Combining these perspectives, we suggest that our SPD estimator renders a valuable tool for risk management and asset pricing. History: Accepted by Kay Giesecke, finance. Funding: The research of C. - **Theories:** Game Theory, Public Goods Theory, Equilibrium Analysis

Abstract:

Morgan and Tumlinson (2019, Management Science 65(10), 4489–4504) study a game in which citizens first fund a company venture or purchase bonds, and then bond holders and the firm's manager, acting on behalf of the shareholders, contribute to a public good. One of their major results is that the venture is funded with positive probability in all trembling-hand perfect Nash equilibria. The purpose of this note is to prove the existence of economies in which the venture is not funded in all trembling-hand perfect Nash equilibria. History: Accepted by Joshua Gans, business strategy.

- **Theories:** Stakeholder Theory, Upper Echelons Theory, Gender Role Congruity Theory, Information Intermediary Theory

Abstract:

This paper examines the impact of female analyst coverage on firms' environmental and social (E&S) performance. Exploiting broker closures as a quasi-exogenous shock to analyst coverage, we find that firms experiencing an exogenous decline in female analyst coverage subsequently show a significantly larger drop in E&S scores than those experiencing an equivalent decline in male analyst coverage. To explore the underlying mechanisms, we develop novel machine-learning models to analyze more than 2.4 million analyst reports and 120,000 earnings call transcripts. Our analysis shows that, compared with their male counterparts, female analysts are more likely to address E&S issues, particularly those involving regulatory compliance, stakeholders, and the environment, in both research reports and earnings conference calls. They also display distinct cognitive and linguistic patterns when discussing E&S issues. Furthermore, female analysts are more likely to issue lower stock recommendations and target prices (lower stock recommendations) following negative E&S discussions in their reports (E&S incidents) than male analysts. Finally, investors respond more strongly to female analysts' negative tones when discussing E&S issues. Overall, our findings suggest that gender diversity among analysts plays a significant role in shaping corporate E&S practices and provide new insights into the origins of gender differences in skills within the equity analyst profession.
