- **Fields:** Strategic Management, Innovation Management, Economics of Science, R&D Management
- **Theories:** Knowledge Spillover Theory, Absorptive Capacity, Complementarity and Substitution Effects

Abstract:

We study how three components of university science—university publications, PhD graduates, and university patents—influence both upstream and downstream innovation in U.S. publicly traded firms that conduct R&D. To measure the relevance of university science to corporate innovation activity, we use machine-learning algorithms and bibliometric data to link university publications, PhD dissertations, and university patents to corporate publications and patents. Identification exploits firm-specific exposure to shifts in federal agency R&D budgets. We find that university science affects corporate innovation primarily through PhD graduates and university patents: PhD graduates raise firm innovation, whereas university patents substitute for corporate patents and lower the need for internal research. In contrast, university publications elicit little direct contemporaneous response on average; however, this pattern varies substantially across sectors and firm capabilities, with stronger complementarities in the life sciences and among firms operating near the technology frontier. Because established firms account for more than three-quarters of all business R&D, understanding how their innovation responds to university publications, PhD graduates, and university patents is central to assessing the broader impact of university science on corporate innovation. - **Theories:** Queuing Theory, Division of Labor, General Purpose Technology Framework, Skill-Biased Technological Change

Abstract:

How does generative artificial intelligence (GenAI) reshape the skills that organizations seek as they adapt to a new general-purpose technology? GenAI effectively retrieves data, performs analysis, and conveys information, so it can substitute for workers doing these activities and complement workers relying on them. A natural consequence is skill deprioritization, a systematic reduction in firms' demand for human skills that GenAI can effectively address as organizations adjust the division of labor and integration of effort. We draw on a theoretically grounded classification of organizing skills—task division, task allocation, information

provision, reward distribution, and exception management—and a queuing theory model of organizing efficiency to predict which skills firms will deprioritize first. Using a quasiexperimental design that leverages the introduction of ChatGPT as an exogenous shock, we analyze 1,820 publicly listed U.S. companies and track changes in their hiring demand patterns over a period of a 612-month window surrounds the shock. We find significant declines in demand for monitoring (reward distribution), operational exceptions, and task division skills, with information provision also showing declines. Task allocation and conflict resolution showed greater stability, suggesting greater reliance on human judgment. These effects intensify following GPT-4’s release, indicating that capability improvements also drive adaptation. Our findings demonstrate that firms engage in immediate and selective skill deprioritization, raising questions about longer-term hollowing out of human expertise in automated domains. We contribute a novel taxonomy of organizing skills, extend queuing theory to the GenAI context, and provide early empirical evidence on how GenAI is reshaping organizational skill demands. - **Theories:** Information Asymmetry, Agency Theory, Contract Theory, Moral Hazard

Abstract:

This paper investigates the optimal design of information disclosure at debt rollover to maximize an entrepreneur’s ex ante borrowing capacity and social welfare. We develop a model where an entrepreneur secures a startup loan for project experimentation and must refinance for production. Borrowing capacity is limited by the pledgeability of project cash flows, which is eroded by three interacting forces: the entrepreneur’s moral hazard, premature liquidation risk following a liquidity shock, and rent dissipation arising from creditor competition. We show that a coarse “pass-or-fail” signal structure maximizes borrowing capacity. This binary structure is informative to balance incentive provision against liquidation risk, yet sufficiently coarse to mitigate rent dissipation. Furthermore, we demonstrate that the welfare-maximizing signal structure remains a pass-or-fail form, with an optimal threshold that tightens as the entrepreneur’s borrowing need increases. - **Theories:** Signaling Theory, Game Theory, Information Economics, Reputation Building

Abstract:

Ratings play a crucial role in online marketplaces, shaping consumer decisions and firm strategies. We investigate how firms strategically use pricing to influence ratings, and how this undermines ratings as signals of product quality. We develop a two-period model of price competition between an established firm and a potentially high- or low- quality entrant, capturing the challenge high-quality newcomers face in building reputation. Consumers rate based on value-for-money, but cannot distinguish whether positive ratings result from genuine quality or discounted prices. Low-quality entrants take advantage of this and may offer low prices to harvest good ratings in the future, or mimic high prices to signal high quality. We show that ratings harvesting inflates positive ratings, reducing their informativeness. This exacerbates the cold-start problem and discourages high-quality entry. Our results mirror empirical patterns and generate implications for how rating design affects market outcomes: reducing effort costs to rate induces more but less-informative ratings, and discourages entry. Thus, actions by major marketplaces to encourage ratings could backfire and induce less precise ratings that discourage entry. To mitigate these effects, policymakers can consider balancing rating effort costs to preserve informativeness, discouraging excessive discounts for new sellers, and incorporating price paid into rating displays. Although the effects of individual entrants' harvesting may appear temporary, harvesting hinders high-quality entrants from building reputation, discouraging entry and causing lasting distortions. - **Theories:** Price Impact Theory, Information Asymmetry, Stochastic Volatility

Abstract:

We develop a simple theory of realized illiquidity, defined as the ratio of realized volatility to trading volume. Building on the widely used price impact measure of Amihud (2002), we introduce the realized Amihud, which significantly improves measurement accuracy. Our theoretical and numerical results show that it robustly captures cumulative intraday price sensitivity to trading, accounting for stochastic volatility, microstructure noise, and information jumps. Empirically, we uncover distinct time-series patterns in realized stock illiquidity—heterogeneous clustering, leverage effects—and show that it predicts short-term returns. Abstract:

We find that shifts toward more liberal (i.e., less probusiness) courts predict reductions in local small business activity. A one-standard-deviation increase in liberal ideology predicts a 1% reduction in firm count relative to bordering counties in different federal court jurisdictions. This effect has more than doubled since 2000 and is particularly pronounced in circuit-years with elevated small business–related federal cases or public attention to the legal environment. The effect manifests predominantly through the exit of young firms, not firm relocations, and coincides with a shift away from litigation-sensitive industries. In summary, we provide the first evidence that small businesses consider judicial ideology, and the accompanying variation in expected litigation costs, when deciding whether or where to operate. - **Fields:** Strategic Management, Innovation Management, Organizational Learning
- **Theories:** Absorptive Capacity, Microfoundations, Knowledge-Based View

Abstract:

We return to the theoretical foundations of absorptive capacity and test the idea that personal experience in a field makes it easier for a firm's inventors to recognize and build upon knowledge in that field from other local firms. We propose a new empirical model of localized knowledge diffusion, which (1) measures a firm's absorptive capacity by its inventors' prior experience in a field, (2) uses a death instrument to exogenously vary the availability of knowledge of the same collaborative patent in different regions, and (3) estimates the difference in citation likelihood from all subsequent inventors across both regions as a function of a potentially citing inventor's prior experience in the field. Consistent with the original theory of absorptive capacity, firms whose inventors have prior experience in a field are more likely to use locally available interpersonal knowledge from other firms; furthermore, this effect declines monotonically with distance. Although the effects strengthen for more recent experience and multidisciplinary knowledge, the greatest benefits accrue to firms in the interaction—those whose inventors have more recent experience and that seek to absorb multidisciplinary knowledge. Interpersonal absorptive capacity within firms does not appear to localize. This paper was accepted by Anita McGahan, business strategy. - **Theories:** Human Capital Theory, Resource-Based View, Jack-of-all-trades Theory

Abstract:

We use career backgrounds of initial employees from a full cohort of U.S. startups to measure founding teams' skillsets. Startups with more diverse prior industry experience grow faster than same-industry local peers. One-standard-deviation-higher diversity is associated with 16% (10%) higher five-year employment (sales) growth, controlling for demographic diversity, prestartup wages, and other observables. Startups in innovative industries and facing lower coordination costs among team members drive the results. To address endogeneity, we exploit shocks in which teams suddenly lose members with unduplicated skills. Overall, combining individual specialization with team-level diversification allows teams to act as "jacks of all trades and masters of each." This paper was accepted by Bo Becker, finance. Fields & Theories:

- **Fields:** International Business, Finance, Behavioral Economics
- **Theories:** Signaling Theory, Information Processing, Media Effects

Abstract:

We examine whether U.S. media sentiment on foreign countries influences domestic investors' international asset allocation. Using flows to country-specific mutual funds as a proxy for investor demand, we find that negative media sentiment, measured by the interaction of negative tone and media attention given to foreign countries, is strongly associated with reduced investor flows into funds targeting those countries. This relationship is driven, at least in part, by media sentiment that is unrelated to the economic fundamentals of the targeted countries. We employ The Wall Street Journal's acquisition by News Corp to support the causal interpretation of our findings. Our results highlight the perception-shaping role of media narratives in driving global investment decisions. This paper was accepted by Will Cong, finance. Funding: L. Ma acknowledges funding support from the National Natural Science Foundation of China [Grant 72103008]. Published: 2026-08-21

Fields & Theories:

- **Fields:** Finance, Financial Economics, Quantitative Methods
- **Theories:** Asset Pricing Theory, Efficient Market Hypothesis

Abstract:

This paper introduces a novel methodology for analyzing anomalies in conditional asset pricing models with time-varying risk exposures and premia. Our approach extends the conventional two-pass methodology to include both ordinary and weighted least-squares estimation in a conditional setting. We establish closed-form standard errors to statistically dissect anomalies, including a version robust to global misspecification. We introduce a novel R^2 criterion to quantify the joint contribution of large anomaly sets in explaining cross-sectional stock return variations. Our analysis highlights the significant impact of anomalies during economic and financial crises, linking them closely with market conditions.

Published: 2026-08-21

Fields & Theories:

- **Fields:** Finance, Asset Pricing, Empirical Finance
- **Theories:** Factor Models, Return Decomposition Framework, Duration-Matching

Abstract:

We study the equity factor zoo using a duration-matching return-decomposition approach that adjusts factor returns by subtracting returns on duration-matched government bond portfolios. By doing so, we remove the component of factor returns attributable to interest rate movements while preserving shocks to expected growth and risk premia observed in the data. Among commonly used factors, the value, investment, and profitability premia increase after duration matching, while the market and size premia decrease, over the post-1981 sample period. Furthermore, the effect of duration matching on mean factor returns depends importantly on the interest rate environment, consistent with our return decomposition framework. This paper was accepted by Kay Giesecke, finance. Supplemental Material: The online appendix and data files are available at <https://doi.org/10.1287/mnsc.2024.08851>.

- **Theories:** Salience Theory, Behavioral Decision Theory, Social Learning

Abstract:

We examine the decision to become an entrepreneur in the context of online business. Using data on entrepreneurs from a large e-commerce marketplace in China, we find that individuals are more likely to start online businesses after observing the salient success of nearby stores. Leveraging the platform's store rating system and detailed geographic information in rural China, we show that an upgrade in a local store's rating leads to a significant increase in new store entries nearby. This effect diminishes with physical distance and intensifies with the salience of the upgrade. However, these entry decisions appear to be suboptimal; entrants driven by local upgrade events underperform in sales and are more likely to exit, especially during downturns in overall market conditions. Our findings are consistent with salience-based theories of decision making, in which individuals overweight highly visible local information. This paper was accepted by Lin William Cong, finance.
