1. Attitudes toward ambiguity among self-employed and incorporated entrepreneurs

Authors: Thomas Åstebro, Frank M. Fossen, Cédric Gutierrez

DOI: [10.1016/j.jbusvent.2026.106601](https://doi.org/10.1016/j.jbusvent.2026.106601) Published: 2026-07-01

Fields & Theories:

- **Fields:** Entrepreneurial Cognition, Behavioral Economics, Decision Sciences
- **Theories:** Decision Theory, Ambiguity Aversion and Sensitivity Framework, Subjective Expected Utility Theory

Abstract:

How do entrepreneurs act on their beliefs when probabilities of outcomes are unknown but subjectively perceived? We theorize that two distinct dimensions of ambiguity attitudes influence entrepreneurial action: ambiguity aversion—the unwillingness to bear ambiguity—and ambiguity sensitivity—how individuals discriminate between different levels of perceived chances of success. The second dimension determines how much entrepreneurs adjust their actions based on new information—a distinct aspect that cannot be captured by ambiguity aversion alone. Our theory suggests that entrepreneurs with different growth orientations have different ambiguity attitudes as compared to employees. Using incentivized measures from a large-scale survey, we find that incorporated entrepreneurs exhibit lower ambiguity aversion than employees, indicating that they are more willing to act under ambiguity. Distinctively, unincorporated self-employed individuals show higher ambiguity sensitivity, indicating that their actions are more responsive to changes in their beliefs. These patterns persist after controlling for risk attitudes, optimism, cognitive ability, and demographics. Our results the distinct impacts of ambiguity aversion and ambiguity sensitivity on entrepreneurial actions.

2. Beyond “uncertainty”: How distinct types of perceived uncertainties catalyze or paralyze firm innovation

Authors: Renfei Gao, Stephen X. Zhang, Asghar Afshar Jahanshahi

DOI: [10.1016/j.jbusvent.2026.106605](https://doi.org/10.1016/j.jbusvent.2026.106605) **Published:** 2026-07-01

Fields & Theories:

- **Fields:** Innovation Management, Entrepreneurial Cognition, Strategic Management
- **Theories:** Perceived Environmental Uncertainty (PEU) Framework, Uncertainty Management Theory

Abstract:

Despite considerable scholarly attention to uncertainty management in entrepreneurship, it remains unclear how entrepreneurs' perceived environmental uncertainty shapes entrepreneurial actions, such as innovation actions, in their firms. A positive view interprets innovation as a promising approach to uncertainty management, thus suggesting a positive effect; while a negative view sees uncertainty as an obstacle to innovation, thereby proposing a negative effect. We reconcile this tension based on the typology of perceived environmental uncertainty (PEU)—i. e., state, effect, and response uncertainty, which respectively focus on the nature of environmental changes, the consequences of any changes for focal firms, and the availability or effectiveness of potential responses. We posit that state and effect uncertainty perceived by entrepreneurs encourages innovation actions, whereby the positive influence of state uncertainty is stronger than that of effect uncertainty. In contrast, we expect response uncertainty perceived by entrepreneurs to discourage innovation actions. Using hand-collected multiple-wave multiple-informant survey data on 146 small firms in Malaysia, we show evidence for most of our arguments. Our study disentangles the distinct impacts of three types of perceived uncertainty, thereby advancing a more fine-grained understanding of when perceived uncertainty catalyzes or paralyzes entrepreneurial action.

3. Founders for hire? The role of venture studios in breaking the individual-opportunity nexus

Authors: Constanze Coelsch-Foisner, Laurens Vandeweghe, Bart Clarysse, Fiona Murray

DOI: [10.1016/j.jbusvent.2026.106600](https://doi.org/10.1016/j.jbusvent.2026.106600) **Published:** 2026-07-01

Fields & Theories:

- **Fields:** Entrepreneurship, Organizational Theory, Venture Creation
- **Theories:** Individual-Opportunity Nexus, Entrepreneurial Agency, Resource Orchestration

Abstract:

Entrepreneurship theory has often posited the founder as the central agent of venture creation; from identifying opportunities, to mobilizing resources, and driving execution. We examine how venture studios – organizations that systematically create new ventures by taking over traditionally founder-led processes – challenge this assumption. Drawing on an inductive multiple case study of 16 venture studios with 50 primary and secondary interviews, we reveal how venture studios develop and validate ideas independently from founders prior to recruiting them, and how they coordinate the entrepreneurial process when these functions are separated. Our findings contribute to the literature on the individual-opportunity nexus, the entrepreneurial process and open the research agenda on venture studios as a new phenomenon in entrepreneurship. Venture studios challenge the assumption that founder and idea are connected. We provide qualitative evidence from 16 venture studios using 50 interviews. Venture studios disentangle opportunity discovery from venture creation. They coordinate the entrepreneurial process through managerial mechanisms. Venture studios shift entrepreneurial agency from individual to the organization.

4. Not me, not yet, not anymore: Founder identity and entrepreneurial disidentification

Authors: Aviel Cogan, Blake Mathias

DOI: [10.1016/j.jbusvent.2026.106584](https://doi.org/10.1016/j.jbusvent.2026.106584) Published: 2026-07-01

Fields & Theories:

- **Fields:** Entrepreneurship, Social Psychology, Social Entrepreneurship
- **Theories:** Identity Theory, Social Identity Theory, Role Identity Theory, Disidentification

Abstract:

Research recognizes that founders may struggle to identify as an entrepreneur. Yet, little is known about the process through which they may identify as not an entrepreneur. We bridge this gap by drawing on a longitudinal, qualitative study to develop the concept of entrepreneurial disidentification and clarify how and why it unfolds and evolves over time. Our findings reveal how entrepreneurial experience can disconfirm an identity as an entrepreneur through both social identity and role identity mechanisms. In doing so, we expand the explanatory reach of founder identity theory and extend its theorization of multiple identities and founder agency. We also advance understanding of identity tensions in the context of social entrepreneurship by problematizing the relationship between empathy and intersectionality.

5. Stories under scrutiny: How entrepreneurs and investors negotiate entrepreneurial narratives in interactional exchanges during investment pitches

Authors: Jean S. Clarke, Nick Llewellyn

DOI: [10.1016/j.jbusvent.2026.106604](https://doi.org/10.1016/j.jbusvent.2026.106604) Published: 2026-07-01

Fields & Theories:

- **Fields:** Entrepreneurial Finance, Organizational Communication, Social Psychology
- **Theories:** Narrative Theory, Interactional Analysis, Sensemaking

Abstract:

Entrepreneurial pitching is normally framed as a unidirectional scripted performance, with entrepreneurs presenting pre-crafted narratives for investor evaluation. We reframe pitching as an interactional process in which stories are scrutinised, challenged, and negotiated through investor-entrepreneur exchanges. We apply sequential analysis to video recordings of the question-and-answer sessions of 14 investment pitches in the UK. Our analysis identifies four recurrent interactional patterns: Unencumbered Storytelling, Resisting Presuppositions, Giving Ground, and Pushing Back. We also show how collective investor dynamics can further shape the trajectory of the pitch story. These findings demonstrate that investors are not passive evaluators but active participants whose individual interventions and collective questioning trajectories enable and constrain entrepreneurial storytelling. By foregrounding the interactional dynamics of pitching, we shift understanding of entrepreneurial storytelling, viewing it as a negotiated process rather than a scripted performance, and highlighting how the persuasiveness of entrepreneurial narratives depends on their capacity to accommodate investor challenges while preserving the integrity of the story.

6. Unchained from land: Property rights reforms and farmers' entrepreneurship in an emerging economy

Authors: Xueru Yang, Xiaoke Shi, Kun Liu

DOI: [10.1016/j.jbusvent.2026.106602](https://doi.org/10.1016/j.jbusvent.2026.106602) Published: 2026-07-01

Fields & Theories:

- **Fields:** Institutional Economics, Development Entrepreneurship, Public Policy
- **Theories:** Institutional Theory, Property Rights Theory, Transaction Cost Economics

Abstract:

How do changes in property rights shape individual entrepreneurship in weak institutional settings? Although secure property rights are widely viewed as essential to entrepreneurial action, most research treats them as static arrangements rather than evolving institutions. As a result, we know little about how property rights reforms influence individuals' decisions to engage in entrepreneurship, or how these effects vary across social and institutional contexts. We address this gap by examining China's 2014–2018 agricultural land titling program, which formalized land use rights through a quasi-natural experiment. Using individual-level survey data and a staggered difference-in-differences design, we find that land titling increases farmers' likelihood of entering self-employment, especially among marginalized groups and in regions with stronger complementary institutions. These findings show the dynamic nature of property rights, showing how institutional reforms allow individuals to reassess uncertainty and realign incentives in ways that motivate entrepreneurial action.

7. Venture boards: Knowns and unknowns

Authors: Bart Clarysse, Johan Bruneel, Carina Lomberg, Timur Uman, Thomas J. Howard, Nicola Breugst

DOI: [10.1016/j.jbusvent.2026.106591](https://doi.org/10.1016/j.jbusvent.2026.106591) **Published:** 2026-07-01

Fields & Theories:

- **Fields:** Corporate Governance, Entrepreneurial Finance, Strategic Management
- **Theories:** Resource-Based View, Attention-Based View, Dynamic Capabilities

Abstract:

Venture boards shape how high-growth ventures learn, decide, and access resources under uncertainty. This special issue advances venture board research by shifting attention from boards as structure (composition and formal attributes) to boards as capability (routines and relational processes that channel attention, orchestrate advice and monitoring, and enable timely decisions). The eight articles collectively explore board composition, its changes over the venture life cycle, consequences on boards, and outcomes. Building on these contributions and the wider literature, this editorial advances five directions for future research: theorizing boards as capabilities and mechanisms, embracing epistemological and methodological pluralism, unpacking micro-level decision dynamics, comparing venture boards with other sources of advice, and situating venture boards in their entrepreneurial ecosystems.

1. AI in science: When and where it makes a difference

Authors: Stefano Bianchini, Valentina Di Girolamo, Julien Ravet, David Arranz

DOI: [10.1016/j.respol.2026.105478](https://doi.org/10.1016/j.respol.2026.105478) **Published:** 2026-07-01

Fields & Theories:

- **Fields:** Economics of Science, Innovation Studies, Artificial Intelligence
- **Theories:** Recombinant Innovation, Diffusion of Innovation, Knowledge Search

Abstract:

Why do some scientific fields benefit far more from AI than others? To answer this question, we study the diffusion and effects of AI across more than 170 scientific fields between 2005 and 2023, drawing on a dataset of over 80 million scientific publications, and assessing its contribution to knowledge creation using indicators of novelty and impact. We find that, on average, the use of AI is associated with more novel and highly cited research, and that these effects are strengthened with recent technological advances (namely, transformers and large language models). However, these benefits are far from uniform. The contribution of AI, especially in terms of novelty, intensifies with its penetration within a field, that is, the extent to which AI is widely adopted and embedded in research practices, and with the “roughness” of the underlying knowledge space, meaning the degree to which ideas are fragmented and combinatorially complex. “The Analytical Engine has no pretensions whatever to originate anything. It can do whatever we know how to order it to perform.” — Ada Lovelace, Notes on Charles Babbage’s Analytical Engine, 1843 “It is usual to say that machines can only do what we tell them to do, but this ignores the fact that they can take us by surprise.” — Alan Turing, Mind, 1950

2. Distinguishing hares and tortoises in the field: Applicants' prediction of patent value flows

Authors: Siwei Cao, Zhen Lei, Brian Davern Wright

DOI: [10.1016/j.respol.2026.105481](#) **Published:** 2026-07-01

Fields & Theories:

- **Fields:** Innovation Management, Intellectual Property, Economics of Innovation
- **Theories:** Signaling Theory, Real Options Theory, Information Asymmetry

Abstract:

Applicants can predict before filing whether an invention will generate high early value flows, even within narrow technical fields. For United States patents with “priority” Chinese applications, an applicant’s choice of Chinese utility model, granted faster but with shorter life than an invention patent, is a significant predictor of early value flow, as proxied by early post-grant citations. In our sample of Chinese - U.S. patent dyads, prior utility model choice significantly positively predicts four proxies for private value of the subsequent US patent: total forward citations, stock market value estimate at grant, litigation and reassignments, but also fewer patent renewals. Higher predicted patent value does not imply more persistent private value flow, falsifying an assumption crucial for estimation of substantial “option value” from patent renewal fees.

1. Abstract patents and startup funding: Evidence from Alice v. CLS Bank

Authors: Josh Feng, Peyton Williams

DOI: [10.1016/j.respol.2026.105462](#) **Published:** 2026-06-01

Fields & Theories:

- **Fields:** Law and Economics, Entrepreneurial Finance, Intellectual Property Strategy
- **Theories:** Transaction Cost Economics, Signaling Theory, Patent Thicket Theory

Abstract:

Through its *Alice v. CLS Bank* ("Alice") ruling, the U.S. Supreme Court tightened eligibility standards for patents covering abstract ideas implemented on a computer, which, in turn, sharply increased examination stringency in a narrow set of technology areas. The decision has generated significant debate among policymakers and practitioners, particularly over its effects on startups, which has led to recent proposals in the U.S. Congress to reform patent eligibility laws. We provide a theoretical discussion and related empirical evidence on the impact of Alice on startup activity. Our empirical analysis complements existing firm-level analyses by estimating industry-level impacts, which can capture effects on entrants and non-patenting competitors that traditional designs may miss. Total venture capital funding in affected industries exhibited an increase of 42 percent relative to less-exposed industries. We show that, in the affected areas, obtaining a patent did not materially increase a startup's likelihood of raising venture capital before Alice, a feature of the affected industries that likely mitigated the potential negative impacts of increased stringency. In addition, after Alice, patent grants fell sharply and newly granted patents became less likely to be purchased by patent assertion entities or litigated, suggesting that reduced transaction costs from patent thickets and reduced monetization of low-quality patents may have contributed to the increased funding.

2. AI users are not all alike: The characteristics of French firms buying and developing AI

Authors: Flavio Calvino, Luca Fontanelli

DOI: [10.2139/ssrn.5010540](https://doi.org/10.2139/ssrn.5010540) **Published:** 2026-06-01

Fields & Theories:

- **Fields:** Economics of Innovation, Digital Transformation, Strategic Management
- **Theories:** Resource-Based View, Complementarity Theory, Self-Selection Theory

Abstract:

In this work we characterise French firms using artificial intelligence (AI) in 2018 and explore the link between AI use and productivity. We distinguish AI users that source AI from external providers (AI buyers) from those developing their own AI systems (AI developers) based on the official French ICT survey, that provides information about the use of AI by firms. AI buyers tend to be larger than other firms, but this relation is explained by ICT-related variables. Conversely, AI developers are larger and younger beyond ICT. Other digital technologies, digital skills, and infrastructure play a key role for AI use, with AI developers leveraging more specialised ICT human capital than AI buyers. Overall, AI users tend to be more productive, however this is related to the self-selection of more productive and digital-intensive firms into AI use. This is not the case for AI developers, for which the positive link between AI use and productivity remains positive and significant. This relationship persists across multiple robustness checks, including analyses addressing endogeneity concerns.

3. Automation, trade and multinational activity: Micro evidence from Spain

Authors: Katherine Stapleton, Michael Webb

DOI: [10.2139/ssrn.5105532](https://doi.org/10.2139/ssrn.5105532) **Published:** 2026-06-01

Fields & Theories:

- **Fields:** International Business, Innovation Economics, Industrial Organization
- **Theories:** Task-based Approach, Global Value Chain Theory, Offshoring Theory

Abstract:

We use a rich dataset of Spanish manufacturing firms from 1990 to 2016 to shed light on how automation in a high-income country affects trade and multinational activity involving lower-income countries. We exploit variation in firm exposure to robotics inventions over time, as measured using ex ante task specialization and the tasks described in new robotics patents. We show that the deployment of robots in Spanish firms had a positive impact on their offshoring to lower-income countries. For

firms that had not yet offshored production to lower-income countries, robot adoption caused them to start newly doing so. By contrast, for firms that were already offshoring to lower-income countries, robot adoption had no effect on their offshoring.

4. Digital skill adoption and employment dynamics: Evidence from matched vacancy-employer-employee data

Authors: Mathias Fjællegaard Jensen, Cédric Schneider

DOI: [10.1016/j.respol.2026.105476](https://doi.org/10.1016/j.respol.2026.105476) **Published:** 2026-06-01

Fields & Theories:

- **Fields:** Labor Economics, Economics of Innovation, Digitalization
- **Theories:** Skill-Biased Technological Change, Human Capital Theory

Abstract:

This paper examines the interplay between firms' investments in digital skills and employment dynamics within the Danish labor market. We employ novel digital skill demand measures derived from online job postings using natural language processing techniques. We document a strong positive correlation between demand for digital skills, particularly in data science and AI, and firm productivity. Using dynamic lead-lag models, we estimate a positive relationship between digital skill investments and firm-level employment. This positive association is broad-based across demographic groups, and is stronger in certain occupations when specifically considering data science and AI skills. While digitalization drives job creation and productivity gains overall, the workforce impacts of specific technologies are heterogeneous. Our results suggest that digitalization, and particularly data science and AI adoption, may amplify existing labor market disparities across occupations, industries, and regions.

5. Dinosaurs of the organizational landscape facing technological disruption: Liability of aging and exaptation in monastic orders

Authors: Jan Simon Danko, Katja Rost

DOI: [10.1016/j.respol.2026.105480](https://doi.org/10.1016/j.respol.2026.105480) **Published:** 2026-06-01

Fields & Theories:

- **Fields:** Organizational Theory, Strategic Management, Innovation Management
- **Theories:** Imprinting Theory, Exaptation, Liability of Aging

Abstract:

Some organizations remain adaptable across centuries while others struggle to evolve and ultimately fade into irrelevance. Only a handful of theories can explain this extraordinary adaptability. We test two competing theoretical perspectives in imprinting research: Liability of aging suggests that older organizations are at greater risk of disruption by modern technologies, but older organizations can also repurpose their imprinted structures and processes to their advantage in a process termed exaptation. To resolve this contradiction, we analyze Catholic religious orders and their monasteries. They represent the oldest extant organizations, were founded in various historical eras, and are facing contemporary challenges posed by digitalization. Our quantitative and qualitative findings indicate that the orders with historically decentralized imprints show higher adaptability in embracing digital innovation. Our results confirm that long-term adaptability is increased in organizations whose imprinted decentralized logics provide a propensity for exaptation. However, these long-standing organizations are also more wary of the negative effects of digital disruption and appear to shield their organizational core more strongly. We contribute to imprinting research by shedding light on the intricate relationship between historically imprinted organizational logics and contemporary organizational practice and the often underappreciated importance of exaptation for long-term adaptability. Sociotechnological change often leads to the decline of older organizational models over time (Schumpeter, 1939). Yet a few remain adaptable over

centuries before eventually becoming obsolete. These include religious organizations, commercial confederations such as the Hanseatic League, dynasties such as the British Empire and the Imperial House of Japan, and some family enterprises, banks, and universities (Hanusch and Biermann, 2020). For example, Catholic monasteries have an average life span of 500 years (Rost et al., 2010) and thus have outperformed the average stock corporation by hundreds of years. The founding of the oldest extant monastic communities dates back more than 1500 years, and these organizations continue to adapt to changing technological environments (Danko et al., 2025). Among the few theories addressing the nexus between historical organizational logics and current adaptability is imprinting theory, which proposes a correlation between organizational age and structure (Stinchcombe, 1965). However, we still know little about how historically imprinted organizational logics shape adaptation to technological change. This paper examines the imprints discernible in the organizational logics of diverse extant Catholic orders as they engage with today's digital environments to address this research question: How do historically imprinted organizational logics shape the digital adaptation of Catholic religious orders?...

6. Managing alliance portfolio interdependencies for innovation: The role of governance choice in new alliances

Authors: Hans T.W. Frankort, Jens-Christian Friedmann, Korcan Kavusan

DOI: [10.1016/j.respol.2026.105475](https://doi.org/10.1016/j.respol.2026.105475) **Published:** 2026-06-01

Fields & Theories:

- **Fields:** Strategic Management, Innovation Management
- **Theories:** Alliance Portfolio Theory, Transaction Cost Economics, Resource-Based View

Abstract:

Firms can govern their alliances through contractual agreements or equity joint ventures, the latter involving the shared ownership of a newly formed legal entity. This paper argues that the governance choice in a new alliance can be a lever for a firm to manage interdependencies in its alliance portfolio. We examine two related ideas. The first is that the choice of governance structure for a new alliance depends on the composition of a firm's alliance portfolio. The second is that this governance choice has implications for the nature of the firm's innovation outputs. Using data on U.S.-listed dedicated biotechnology firms, we find that firms are more likely to govern a new alliance through a contractual agreement when the accessed resources are similar to the resources available in their existing alliance portfolio. This choice also increases innovation in these similar resource domains. In contrast, firms are more likely to choose an equity joint venture when the accessed resources are complementary to their existing alliance portfolio, a choice that increases innovation in these complementary resource domains. Our findings extend the alliance-portfolio perspective by linking portfolio interdependencies to the governance choices in new alliances and their implications for innovation. Firms use governance choice in new alliances to manage alliance portfolio interdependencies. Contracts are preferred when accessing resources similar as in existing alliances. Joint ventures are preferred when accessing resources complementary to existing alliances. Governance choice influences the types of innovation outputs the firm achieves. Contracts foster innovation in similar domains and JVs in complementary domains.

7. Political, economic and research disintegration: The impact of geopolitical uncertainty on innovation and cross-border R&D collaborations

Authors: Enrico Vanino, Mustapha Douch, Ismail Çakmak

DOI: [10.1016/j.respol.2026.105471](https://doi.org/10.1016/j.respol.2026.105471) **Published:** 2026-06-01

Fields & Theories:

- **Fields:** International Business, Innovation Policy, Political Economy
- **Theories:** Institutional Theory, Real Options Theory, Transaction Cost Economics

Abstract:

Uncertainty regarding the policy environment could be particularly detrimental for innovation, as it requires high-risk investment, and long-term commitments with scientists and research partners. This paper focuses on the effects of geopolitical uncertainty on innovations patenting and cross-border R&D collaborations, exploiting the UK exit from the EU as a quasi-natural experiment in a Difference-in-Difference (DiD) analysis. Our results reveals a significant disruption in cross-border research collaborations of UK organisations after the Brexit referendum, as EU based inventors were replaced by UK ones. Overall, the disruption has affected negatively the innovations of UK based organisations, decreasing the number of inventions patented overseas and their quality.

8. Specialisation and the career outcomes of inventors

Authors: Jordan Bisset

DOI: [10.5465/amproc.2025.21918abstract](#) **Published:** 2026-06-01

Fields & Theories:

- **Fields:** Economics of Innovation, Human Capital, Sociology of Science
- **Theories:** Human Capital Theory, Knowledge Obsolescence, Knowledge Recombination

Abstract:

Recent years have seen a reorganisation of innovation production to favour groups of collaborators, and increasingly specialised individual inventors. In this paper I construct a panel of highly prolific inventors, whom I observe frequently throughout their career. I develop a simple setting whereby inventors face a trade-off between acquiring knowledge depth and knowledge breadth. Empirically, I provide suggestive evidence that after conditioning upon the selection of inventors into specialised careers in certain technological fields, specialisation is associated with a lower probability of contributing to a top-cited invention over the remainder of their career. This suggestive evidence is consistent with a mechanism where specialised inventors are vulnerable to knowledge obsolescence in the late stages of their career. The negative relationship between specialisation and highly cited inventions is concerning given the disproportionate value of such inventions to society.

9. The duality of duality: Generative and disruptive climate configurations for innovation

Authors: You-Na Lee, John P. Walsh

DOI: [10.1016/j.respol.2026.105479](#) **Published:** 2026-06-01

Fields & Theories:

- **Fields:** Innovation Management, Organizational Behavior, Public Management
- **Theories:** Organizational Climate Theory, Configurational Theory, Paradox Theory

Abstract:

Organizational climate is seen as a key driver of organizational performance, including sustained innovation. However, there is limited work on the effects of climate duality on innovation. The co-existence of two distinct climate dimensions (duality) in an organization creates the potential for both generative and disruptive dualities. By dividing the innovation process into an idea generation stage and an innovation implementation stage, we develop a theory linking climate duality and the generative–disruptive dichotomy at each stage of the innovation process. In particular, we argue that climate duality should be generative at the idea stage and disruptive at the implementation stage. Using data from the 2018 Australian Public Service Employee Census (N = 59,870), we test the distinct effects of climate duality at each stage. We conclude with a discussion of the implications of these findings for theories of work climate and innovation. Advance workplace climate research with a configurational approach

examining interactions among multiple workplace climates Theorize relationship between duality (co-existence of go-getter and inclusive climates) and stages of innovation process Use Australian Public Service Employee Census to show climate duality benefits idea generation (a divergent process) Find climate duality hinders implementation (a convergent process), revealing paradoxical effects on innovation Extend theories of climate duality and innovation to public organizations, contributing to cross-sector understanding

10. Understanding working of patents: Empirical evidence based on India.

Authors: Ruchi Sharma, Tanmay Sharma, Madan Dhanora, Puneet Gupta

DOI: [10.1016/j.respol.2026.105464](https://doi.org/10.1016/j.respol.2026.105464) **Published:** 2026-06-01

Fields & Theories:

- **Fields:** Intellectual Property Rights, Innovation Policy, International Business
- **Theories:** Liability of Foreignness, Commercialization of Innovation, Institutional Theory

Abstract:

This paper focuses on patents that are commercially worked or not based on novel dataset on working of patents from Indian patent office. The information based on Form 27, mandated by Section-146 of the India patents act, is collated from the patent office website. This information is aligned with patent-level indicators representing ownership, technological complexity, and quality, as well as their influence on the decision of patentees to work or not work the patent. On average, approximately 75% of patents are not in working status, with most of these patents belonging to non-residents. However, if a patent is owned by a resident the marginal probability of working it increases by 17.2%. This result supports the argument that residents are actively using novel technologies. However, non-residents may find it challenging to work a technology away from home as they report prospective reasons for non-working of the patent. Our findings have implications for theory and practice for patent policy in emerging countries like India. We support the use of Form 27 as a tool to recognize commercialization challenges faced by patentees in India and to design relevant policy interventions.

11. Unlocking firm innovation under regional disadvantage: Can psychological openness compensate?

Authors: Markus Grillitsch, Sam Tavassoli, Martin Obschonka

DOI: [10.1016/j.respol.2026.105463](https://doi.org/10.1016/j.respol.2026.105463) **Published:** 2026-06-01

Fields & Theories:

- **Fields:** Regional Innovation Systems, Economic Geography, Innovation Management
- **Theories:** Absorptive Capacity, Schmoekler's Scissors Metaphor, Regional Endowment Theory

Abstract:

Firm innovation is strongly shaped by regional endowment – defined here as regional supply- and demand-side conditions for innovation – yet many regions are disadvantaged by having low levels of such endowment. While recent research increasingly emphasizes the role of regional soft factors, such as psychological openness, we still know relatively little about how such factors influence firm innovation under conditions of low structural endowment. Theoretically, we draw on Schmoekler's scissors metaphor to conceptualize regional supply and demand conditions as hard, structural endowments of regions. We argue that favorable regional soft conditions – specifically psychological openness – can partially offset these structural constraints, but only for firms that possess sufficient absorptive capacity to recognize, absorb, and exploit such favorable regional conditions. Using longitudinal firm-level data on Swedish firms from 2004 to 2018, we show that regional psychological openness does not have a universal positive effect on product innovation. Instead, our results indicate that the benefits of regional openness are concentrated among firms with higher absorptive capacity operating in regions with low endowment, while firms in regions with

higher endowment do not benefit in the same way. Implications for research and policymaking are discussed. Regional soft factors are associated with firm innovation outcomes. Regional psychological openness may offset regional structural disadvantages. Firms need absorptive capacity to benefit from regional psychological openness. Hard and soft factors at firm and region levels jointly shape firm innovation. In high-endowment regions, psychological openness may coincide with lower innovation.
